

Bringing Optical Character Recognition to MEDITECH's Scanning and Archiving

Does your staff wish there was a better way to quickly find needed information in your business office documents? Do you have a large number of scanned images that are inaccessible due to the inability to search their content?

The Solution

Find-It is an advanced search tool that uses optical character recognition and can be integrated with MEDITECH's SCA application, allowing for content searches within your saved images. Find-It can be directed to any network directory containing scanned images and can quickly incorporate legacy and newly added images to your search capabilities.

Designed with MEDITECH

Find-It was designed in collaboration with MEDITECH to ensure it meets the specific needs of MEDITECH customers. Find-It utilizes a common color palette and similar screen design as MEDITECH 6.0, allowing for a more familiar interaction by your users. When integrated with MEDITECH SCA, Find-It provides a streamlined workflow while running as a self-contained system, virtually reducing any impact on MEDITECH system performance.

How it Works

All existing, migrated, and newly-scanned images reside in MEDITECH's Long-Term Storage, which is continuously monitored by Find-It for new images. When a new image is found, Find-It converts the document's full content into a searchable, text-based document to be stored in an SQL database for future querying. When a user is ready to query the database, they simply click the Find-It button within MEDITECH. The end user is then launched into Forward Advantage's FOX Document Viewer, a tool already familiar to many MEDITECH migration customers. The FOX Document Viewer contains searchable fields and drop-down libraries, and queries are easily performed by entering a content description, key words, date range, or form type. Document query results appear in a separate window within the same screen and can be selected for a more detailed view.

A Secure System

As with any patient information, scanned images are no exception when it comes to security. A user's ability to print or download a queried document depends upon their user assignment or group. Downloading the document automatically prompts the user for a passphrase to be used in the encryption of the scanned document. Additional security features include the ability for a user to blackout private or protected information before downloading the document and to audit all queried information.

Key Features:

- Rapidly deployed and simple to maintain, with minimal impact to user workflow
- Integration with MEDITECH; however, runs as a self-contained system which has no impact on MEDITECH system performance
- MEDITECH 6.0 user interface design for instant familiarity
- Built-in security including access management by user role and assignment, along with the ability to blackout private information
- Built-in auditing to track data access
- Supports common image types including TIFF, PNG, and GIF
